Figure 1: A discrete time control input with zero order hold applied to a continuous time system.  $G_k(j) = 1 - e^{-sT}$  : (11) For stability, the eigenvalues of  $G_m$  must have magnitude  $< 1$ . So if the continuous time plant is stable ( $\text{eig}(A) < 0$ ) the discrete time plant will have eigenvalues with magnitude less than 1.

Discrete time control systems. The standard number system used for processing digital signals is the binary number system. In this system the code group consists of  $n$  pulses each indicating either "on" (1) or "off" (0). In the case of quantizing,  $n$  "on-off" pulses can represent  $2^n$  amplitude levels or output states.
