~~Computer Networks Vs. Distributed Systems~~

A computer network is a collection of separate but interconnected computers, connected by a single technology. Even

a distributed system is a collection of independent computers. But the main difference is that, in a distributed system, the whole collection of computers appears to its users as a single coherent system.

Distributed Systems and Networks
Research in networking and distributed systems focuses on enabling communication of and orchestrating coordination of a large number of computing nodes. It spans the areas of cloud computing, big data computing, and wireless and mobile computing.

~~What is a Distributed System?~~

~~Definition from Techopedia~~

A distributed system is a system whose

components are located on different networked computers, which communicate and coordinate their actions by passing messages to one another. The components interact with one another in order to achieve a common goal.

The idea behind distributed systems is to provide a viewpoint of being a single coherent system, to the outside world. So, the set of independent computers or nodes are interconnected through a Local Area Network (LAN) or a Wide Area Network (WAN). For more information, read my previous blog on " Introduction
