32-bit microprocessor Based on application: General-purpose microprocessor- used in general computer system and can be used by programmer for any application. Examples, 8085 to Intel Pentium. Microcontroller- microprocessor with built-in memory and ports and can be programmed for any generic control application. Example, 8051.

OVERVIEW MICROPROCESSORS

- Every microprocessor has arithmetic operations such as add and subtract as part of its instruction set. – Most microprocessors will have operations such as multiply and divide. – Some of the newer ones will have complex operations such as square root.
- In addition, microprocessors have logic operations as well.
