*GPCR-ModSim Tutorial I*

ModSim32 is an expanded version of the popular 16-bit application ModSim. It is a Win32 application designed to operate as one or more MODBUS slaves, simulating data which may be accessed from a MODBUS master application.

*MODSIM III - A Tutorial*

MODSIM III - A Tutorial - This tutorial introduces the MODSIM III language, showing how its simulation "world view" together with its object-oriented architecture and built in graphics contribute to successful simulation model building. 1 WHAT IS MODSIM III?

*MODSIM III - The Modular Simulation language*

•MODSIM III Tutorial - Provides a broad overview of the language features of MODSIM and then concentrates on the object-oriented programming and simulation capabilities in MODSIM.

of the tutorial focuses on a particular aspect or modeling construct which the application provides. Each chapter in the tutorial will use the following format: 1. The objective of the chapter will be stated. 2. COMNET III constructs and theory which will be used in the chapter will be presented.

ModSim is an MDI application which allows you to define multiple blocks of data points which may then be accessed from a connected modbus master. Each document opened within ModSim may be configured to represent data from the same or different slave node thereby providing simulation for an entire group of devices.

### *MODSIM III—a tutorial*

The Modular Simulation language, MODSIM III, is an object oriented, strongly typed, general purpose, high level programming language. MODSIM III provides both object oriented programming and discrete event simulation capabilities in one language.

### *WinTECH Software Modbus Applications*

This work examines the mathematical assumptions underlying the so-called "Big Sky Theory" (BST).
