And variables, there's a bunch of ways you can think about them, but they're really just values in expressions where they can change. The values in those expressions can change. For example, if I write x plus 5, this is an expression right over here. This can take on some value depending on what the value of x is.

Expressions and variables. An algebraic expression comprises both numbers and variables together with at least one arithmetic operation. Example. $4x - 3$ A variable, as we learned in pre-algebra, is a letter that represents unspecified numbers. One may use a variable in the same manner as all other numerals:

Expressions and Formulas Formulas A formula is a mathematical sentence that uses variables to express the relationship between certain quantities. If you know the value of every variable except one in a formula, you can use substitution and the order of operations to find the value of the unknown variable.

as a variable in algebra, but variables can be any letter. An expression such as $2 + 110$ is an algebraic expression because it is a combination of variables, numbers, and at least one operation. You can evaluate algebraic expressions by replacing the variables with numbers and then finding the numerical value of the expression.
