xml - How do you output the current element path in XSLT ...

XPath. lxml.etree supports the simple path syntax of the find, findall and findtext methods on ElementTree and Element, as known from the original ElementTree library (ElementPath). As an lxml specific extension, these classes also provide an xpath() method that supports expressions in the complete XPath syntax, as well as custom extension functions. ...

XML and XPath - w3schools.com

An XML application. Formally, XSL consists of three parts: XSLT, XPath, and XSL-FO: XSLT : the transformation engine. XPath : for identifying specific elements in an XML tree. XSL-FO : formatting objects. XSL-FO describes a “printable” page with text a little bit like PostScript does, but without graphics.

make decisions about which elements to hide and display, and a lot more. XSLT uses XPath to find information in an XML document.

Overview of XSLT and XPath

At bottom, XSLT is a language that lets you specify what sorts of things to do when a particular element is encountered. But to write a program for different parts of an XML data structure, you need to specify the part of the structure you are talking about at any given time.

XSL and XSLT

Don't think this is built into XPath, you probably need a recursive template, like the one here, which I've based this example on. It will walk every element in an XML document and output the path to that element in a style similar to the one you've described.
